Activity

Skiing

We spent two days skiing around Cooke. We found generally stable snow south of town at 10k on north aspects. We noticed solar aspects becoming wet mid morning (9-10am). The wind did not seem to help keep the surface cold. While north of town above Sheep Creek, i observed small wind slabs at 9-10k (E/NE) There were also crust layers at the same elevation from the previous days.

Region

Cooke City
