Avalanche Cycle in Cooke City

COOKE CITY Cooke City 2/21/2023 Code SS-N-R2-D2-I Aspect NE Latitude 45.02020 Longitude -109.93800

Notes

Photos of some recent natural avalanches near Cooke City today attached. All of the slides observed appeared to just involve new snow from the Feb. 20-21 storm. (occuring on all aspects, but primarily on NE aspects)

New snow: generally about 50-80cms of settled new snow from Feb. 20-21.

Quite a bit of collapsing experienced today while breaking trail, particularly in the lower elevations.

Snowpit attached from a SE aspect at 8500'. HS: 170.

ECTP15-55cms down, at new/old interface.

from 23 February email:

Northerly aspect, around 9900' on this avalanche photo from Woody Ridge attached.

The other, larger natural avalanche up Republic Creek that I mentioned observing today was also on a N, NW aspect, around 9900', but about 4 times as wide.

The Fin also had a relatively large natural avalanche on it too- low on the slope, skier's left.
