

A Mix of Dirt and Snow at History Rock

Date

Thu, 11/14/2024 - 11:10

Activity

Skiing

Ian and I drove up the Langhor Road in Hyalite Canyon in order to access the upper meadows of History Rock. We wrapped around and intersected with the trail in the mid-elevation meadows. Snow depths varied from 0" to 18." We toured into the middle of the three ski meadows before stopping to assess how the season's thin snowpack is evolving. The snowpack has a relatively simple, three layer structure. The lowest layer is beginning to show signs of weakening (faceting). However, the foundation of the snowpack was looking pretty good for now. ECTX. While we are optimistic for now, the snowpack is thin and can change quickly this time of year. There was evidence of wind in the History Rock area, this has likely built wind-slabs at higher elevations and more open terrain.

The critical piece of information is that at mid to upper elevations the ground is mostly covered and we have a layered snowpack. We will stay tuned to how the snowpack evolves and how well subsequent storms bond to what we have on the ground.

Region

Northern Gallatin

Location (from list)

History Rock

Observer Name

Dave Zinn
