

Surface Conditions in Hyalite

Date

Wed, 01/29/2025 - 11:20

Activity

Skiing

Large surface hoar across a variety of elevations and aspects at Lick Creek. It was 2-5mm large and present on almost all flats and non-solar aspects, and from the road up to 8500 ft and above. The most recent snow was wetting out on the solars, and temperatures were well above freezing at my car when I got back to it in the early afternoon.

Region

Northern Gallatin

Location (from list)

Lick Creek

Observer Name

Wyatt Hubbard
